

ADAPTIVE TELECOM EVIDENCE FOR PAYMENT DECISIONS

Keep routine payments instant. Investigate risk before money moves.

SafePay adds CAMARA network observations to bank context only when risk warrants it, using bounded AI tool orchestration and deterministic release policy.

Working FastAPI prototype**Nokia sandbox verified****Egypt - Saudi Arabia - UAE**

Payment systems and mobile networks see different pieces of the same attack

The payment provider sees

- Amount and recipient relationship
- Payment channel and customer history
- Session and transaction anomalies
- Customer-reported scam context

The mobile network can observe

- Recent SIM change
- Number association through supported authorization
- Recent device change
- Roaming and reachability status

SafePay orchestrates those observations as evidence. It does not treat any single signal as proof of fraud or payment intent.

Decision-first orchestration avoids unnecessary calls

Mandatory exception: first setup and a new phone always require fresh Number Verification and SIM Swap checks before device trust.

A focused payment-review workspace

- Market, use case, channel, amount, and recipient context
- Separate pre-call and final risk scores
- Visible source labels for fixtures and Nokia sandbox evidence
- Expandable agent and policy trace
- Built-in 36-case acceptance evaluation

No payment is executed. The interface demonstrates the decision layer that a bank or payment provider would call.

S

SafePay MENA

Adaptive telecom evidence for instant payments

Service ready

Payment review

Routine payments stay instant. Elevated risk triggers a bounded evidence investigation before money moves.

FIXTURE DEMO

1 Choose context

2 Run review

3 Inspect outcome

Transaction context

Select a repeatable judge scenario or Nokia sandbox mode.

Market

Egypt

Saudi Arabia

United Arab Emirates

Evidence mode

Repeatable fixture

Scenario

Everyday payment

A familiar recipient, established device, usual amount.

Payment channel

Instant account transfer

Amount

200

Recipient relationship

Family / known

EGP

Egypt - InstaPay / IPN

Review payment

No payment is executed. Live mode is restricted to Nokia's documented simulator subjects.

LOCAL SCREENING

Payment approved

Required checks found no blocking evidence. The payment may continue.

Pre-call score

0

Final risk score

0

Agent turns + CAMARA tools

0

Why this happened

Routine context stayed below the investigation threshold; no external evidence was requested.

Network evidence

Agent and policy trace

Acceptance evaluation

Runs 36 synthetic workflow checks across Egypt, Saudi Arabia, and the UAE. This is software QA, not a fraud-accuracy claim.

Run 36-case evaluation

Prototype uses simulated bank context. Nokia mode uses sandbox APIs and independent simulator subjects; production mobile networks and payment rails are not connected.

One decision layer, multiple payment risks

Journey	Why SafePay acts	Expected disposition
Everyday payment	Known recipient, usual amount, established device	APPROVE - zero calls
First setup / new phone	Device trust has not been established	VERIFY, then continue
Suspicious transfer	Customer reports bank-transfer instructions from a caller	HOLD
SIM / device takeover	Network changes combine with session and payment anomalies	BLOCK
Card leakage / CNP	Checkout cannot verify the expected number and device context	BLOCK
Planned travel	Roaming is expected and identity evidence is clean	APPROVE
Provider unavailable	Required evidence is missing or rate-limited	RETRY - never fail open

Five Nokia Network as Code tools behind one restricted gateway

CAMARA capability	Prototype use	Verified boundary
SIM Swap	Observe a change inside the requested window	Boolean only; exact age is not invented
Number Verification	Check the expected number association	Bound OAuth state and allowlisted redirects
Device Swap	Add device-change evidence for anomalous sessions	Not equivalent to app-device ownership
Roaming	Add travel context when relevant	Roaming alone is not fraud
Reachability	Retrieve availability when selected	Unreachability alone is not fraud

Live checks use only Nokia's documented +99999991000 and +99999991001 simulator subjects. Production MENA operator coverage is not claimed.

The agent chooses evidence; policy controls consequences

Context-aware selection

The model receives transaction facts and pre-screen reasons, never the canned scenario label.

Bounded execution

Five allowlisted tools, fixed schemas, no model-selected phone or URL, no repeat calls, and a hard evidence budget.

Fail-closed policy

Missing required evidence prevents release. Independently supported blocks remain blocked; the model cannot fabricate an observation.

Accepted tool calls, evidence status, summarized failures, and the final policy source are exposed in the result trace.

Tests verify decisions, orchestration, failure handling, and experience

MENA MARKET CONTEXTS

60

PARALLEL ISOLATED REVIEWS

5

CAMARA TOOLS

Automated boundaries

- HTTP API and idempotency
- Nokia response validation and OAuth state
- Agent call budgets and invalid tool requests
- Rate limits, timeouts, and malformed providers

Browser acceptance

- All major scenario outcomes
- Enrollment continuation and retry
- Cancellation and stale-state clearing
- Desktop, mobile portrait, and landscape overflow

Measured behavior is software QA against fixtures and sandbox APIs, not a claim of real-world fraud detection accuracy.

Deploy once per payment provider; configure by market and operator

Egypt

EGP

Prototype context for InstaPay / IPN payment journeys.

Saudi Arabia

SAR

Prototype context for sarie payment journeys.

United Arab Emirates

AED

Prototype context for Aani and card-checkout journeys.

Buyer

Banks, wallets, processors, and instant-payment applications integrate a decision API before release.

Commercial model to validate

Platform fee plus usage-based investigated transactions, aligned to operator API economics and measured pilot value.

WHAT WE NEED NEXT

Validate SafePay with one operator and one payment provider.

1 - Connect

Confirm available APIs, consent flow, simulator-to-production differences, and operator coverage.

2 - Pilot

Replay consented, labeled fraud and legitimate cases in a bank sandbox with agreed controls.

3 - Measure

API latency, intervention rate, false positives, prevented loss, customer friction, and unit economics.

SafePay MENA: network evidence when it matters, deterministic control before money moves.
